

PI PROP INTELLIGENCE

OWNER OPERATIONS SCHEDULE

Daily, weekly, monthly, seasonal, release, and incident procedures

CURRENT EDITION Updated through August 21, 2026. Web/PWA release; no App Store or Play Store distribution is assumed.

Prepared for PI PROP INTELLIGENCE LLC

Independent sports research and intelligence only. PI does not facilitate wagering or accept bets.

Contents

1. Daily opening
2. Daily closing
3. Weekly review
4. Monthly review
5. Season and provider readiness
6. Release day
7. Incident playbooks
8. Feature smoke checklist
9. Owner records and escalation

1. Daily opening check (10-15 minutes)

1. Sign in with the verified owner account; confirm Pro/Owner mode and open Owner Ops.
2. Run All Checks and wait for current timestamps.
3. Confirm API, PostgreSQL, Redis, queue, and expected workers are healthy.
4. Review provider state: Active, No Current Inventory, Stale, and Outage; confirm last successful update per expected provider.
5. Check quota reserve, cooldown/rate-limit state, failed jobs, and scheduled sync completion.
6. Confirm board freshness, event counts, playable counts, scoreboard latency, and image/headshot health.
7. Review failed payments, unsettled slips, questionable grades, pipeline alerts, and owner notifications.
8. Confirm production frontend/backend commit matches the intended release.
9. Open Market Board, one prop research overlay, Scoreboard, Active Slip, and an empty-season sport on desktop and phone width.

Signal	Healthy target	Escalate when
API / database / Redis	Healthy and current	Any dependency is unavailable or repeated recovery mode persists.
Providers	Expected sources Active or honestly No Inventory	Expected source is Stale/Outage or last success crosses policy.
Props	Counts fit current event schedule	Sudden unexplained collapse, wrong sport, mixed providers, or stale recommendations.
Images	Headshots or branded fallback remain stable	Black circles, flicker, repeated URL failures, or mapping collapse.
Grading	No unexplained overdue pending legs	Final games remain unresolved or manual correction lacks evidence.

2. Daily closing check (5-10 minutes)

1. Review provider alerts and document any outage or low-quota period.
2. Review today's locked/settled tickets and current win/loss percentage; investigate inconsistent grading.
3. Confirm line snapshots recorded for upcoming markets and no stale recommendation remained promoted.
4. Check failed payments, auth/security alerts, unresolved chat reports, and owner follow-ups.
5. Record incidents, manual actions, and the next owner/date before signing out.

3. Weekly review (30-45 minutes)

Area	Review	Expected result
Providers	Error rate, quota, cooldowns, coverage, inventory gaps, last success	No unexplained stale source; no outage mislabeled as no inventory.
Model / track record	Sample, calibration, release gates, CLV, sport/site/market breakdown	Rates shown with adequate sample; losses and caveats remain visible.
Workers / cron	Queue depth, retries, failed jobs, historical/headshot/schedule jobs	Expected jobs complete; no old failure backlog.
Billing	Webhook authentication, idempotency, failed payments, entitlement mismatch	Access matches verified RevenueCat state.
Auth / security	Supabase advisor, Turnstile, rate limits, owner MFA, logs	No exposed secrets or unresolved security finding.
Performance	First load, board, scoreboard, overlays, mobile interactions, API latency	No significant regression from the prior week.

4. Monthly review (60-90 minutes)

- Confirm Supabase backup and retention/PITR policy; document restore readiness.
- Review Vercel, Render, Redis, database, provider, RevenueCat, and OneSignal usage/cost trends.
- Audit owner/admin/tester roles, paid entitlements, inactive accounts, and public signup policy.
- Review privacy, terms, contact, pricing, and Complete Application Guide for changes.
- Reconcile supported sports and six prop-site labels against current configuration.
- Review model drift, calibration, release thresholds, stale-data suppression, and owner top-pick quality.
- Run desktop, narrow phone, tablet, laptop, and ultrawide visual checks; include browser zoom and keyboard navigation.

5. Season and provider readiness

Timing	Actions	Verify
Before season	Confirm schedule source, sport navigation, provider mappings, categories, player identity, headshots, and model inputs.	Season panel shows real next event; no hard-coded date; markets transition automatically.
Market opening	Confirm provider inventory, site separation, counts, line history, freshness, and playable classifications.	Cards match source; no mixed provider rows or blank grid slots.
In season	Monitor daily schedule, quota, late lineup/injury changes,	Active data is current; owner alerts

Timing	Actions	Verify
	stale alerts, and grading.	are actionable.
Postseason	Confirm event filters and schedule boundaries; preserve playoff context.	No premature offseason label.
Offseason	Confirm schedule-aware empty state and historical research availability.	No generic broken-feed message when the season is legitimately inactive.

6. Release day procedure

1. Review worktree and intended files; leave unrelated artifacts uncommitted.
2. Run targeted tests for changed features and the broad backend suite; understand any failing Flutter tests before release.
3. Commit with a descriptive message and push main.
4. Confirm GitHub, Vercel, and Render report the intended commit.
5. Update the production PWA when prompted, then hard-refresh only if the old bundle remains.
6. Smoke auth, board, sport/provider filters, headshots, research overlay, add/remove selection, active slip, scoreboard, history, chat, membership, and Owner Ops.
7. Check console/frontend errors, API latency, image failures, provider freshness, and queue health for at least one full refresh cycle.
8. Record release commit, result, known warnings, and rollback commit.

7. Incident playbooks

Signal	Immediate action	Do not
API unhealthy	Check Render deploy/restarts, /ready, database, Redis, and release commit.	Do not redeploy repeatedly without isolating the dependency.
Provider stale/outage	Check last success, quota, cooldown, worker, cache, and upstream response.	Do not force-refresh through a rate limit or call no inventory an outage.
Prop count collapse	Compare schedule, selected sport/site, provider totals, catalog source, and filters.	Do not publish placeholder or fabricated props.
Headshot failures	Check mapping key, image URL, cache sync, and branded fallback.	Do not render an empty black circle.
Scoreboard slow	Check provider latency, cache path, and API timing.	Do not disable caching as the first response.

Signal	Immediate action	Do not
Paid access mismatch	Check RevenueCat event, entitlement, webhook, and Supabase profile.	Do not grant access from a browser success message alone.
Questionable grade	Confirm final event, official stat, market rule, and stored selection.	Do not manually grade from incomplete live data.

8. Feature smoke checklist

Feature	Minimum acceptance check
Market Board	Props load; providers separated; balanced rows; filter/search clear correctly; status age is honest.
Season status	Sport-only empty state shows schedule; real filters show filtered-empty; date/countdown derives from live schedule.
Prop card	Headshot stable; EP alone opens player props; Over/Under add and undo; View Research opens readable overlay.
Line Movement	At least known moved fixtures hydrate opening/current values; no false same-line movement.
Officiating	NBA/WNBA referees and MLB umpires load or show a truthful no-data state; no NFL tab.
Slip	Counter, icon, remove, save/lock, live tracking, and settlement transitions work.
History	All/Won/Lost, today win/loss percentage, result cards, and text fit without clipping.
Responsive shell	Left sections retain state; right rail labels/counters do not overlap; mobile filters/dialogs do not clip.

9. Owner records and escalation

Record	Value
Review date / owner	_____
Production commit	_____
Frontend/backend deploy status	_____
Provider freshness / quota	_____

Record	Value
Props / playable / events	
Model sample / calibration	
Unsettled / questionable items	
Backup / security verified	
Actions and follow-up owner/date
